Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1904 Excerpt: .the region of the appendix. Pulse over 120; temperature 1060. In this case, the hyperpyrexia practically excluded the appendix as it cause. It did not, however, exclude the possibility of coexistent appendicitis. What made the latter diagnosis improbable was the fact that local pressure did not increase the ileocaecal distress, and that a suitable antipyretic in time relieved all regionary symptoms. Plasmodia established the malaria. The diagnosis of this and a number of similar cases in which the malaria was not so readily suspected on account of the absence of chill, or because the temperature at the time of observation was very much lower, is apparently very simple at a distance from the bedside; confronted with the situation, however, some worrisome moments are apt to ensue. This has been noted, perhaps, more particularly in younger children, in whom abdominal examinations prove very often anything but satisfactory. Type of Malaria Coexisting with Appendicitis.--Louis G., 14 years of age, unusually well and strong. Never, during a nine years acquaintanceship, suspected of having malaria. November 20, 1901: While at school, seized suddenly with cramps and vomiting. On examination tenderness was found in customary region, but nearer to spina superior ilei; some rectus resistance. Pulse 76; rectal temperature 100; spleen small. Diagnosis: Appendicitis. November 21st, a. m.: Pain and tenderness totally disappeared; slight ileocecal sensitiveness only on very deep inspiration. Pulse 72; rectal temperature 99.0. Toward evening seized suddenly with chill, lasting 10 minutes; pulse, 90; temperature, 102.0. No...
